Figure 1 – Gold Price Sensitivity

The graph illustrates the sensitivity of Net Present Value (NPV) and Internal Rate of Return (IRR) to changes in the gold price per ounce (Au [US$/oz]). The NPV is positively correlated with increases in the gold price, while the IRR exhibits a similar trend but at a higher percentage for the same range of gold prices. The data points are marked with red squares for NPV and blue diamonds for IRR, showing a clear upward trend as the gold price increases from $1200 to $1600 per ounce.
